RCM RADIO MEDIA

Quick User Guide

A simple path for listeners and the RCM admin team

What this guide covers: open the site, follow its shows and news, publish reviewed updates, and check that feeds are healthy.

Listener journey

1 Explore RCM

Browse the homepage, programme schedule, news, partner offers and recorded content.

2 Listen and follow

Choose Listen Live or open a recording. Live audio works when a stream has been configured.

3 Get email updates

Choose show news, headline links or both on Email Updates, then confirm your address from the email.

4 Contact RCM

Send a message or comment. Messages go to the admin inbox; comments appear after approval.

Admin workflow

1 Start the local test site

Start XAMPP Apache and MariaDB. On this computer, use the restart commands in the project README if services are stopped.

2 Sign in

Open **/admin/login.php** on the site and sign in. The dashboard is private to admins.

3 Collect updates

Refresh news feeds and sync social platforms from their dashboard controls. YouTube uses a public feed; Facebook and TikTok require approved API credentials.

4 Review before publishing

Check source, accuracy, link and rights. Approve suitable items; reject unsuitable ones. Imported content stays private until approved.

5 Publish RCM content

Add original news and programmes, set schedule/visibility, and verify the public pages. Check partner details before promoting an offer.

6 Handle listeners and partners

Review comments and uploaded partner media. Read contact messages and reply using your normal email account.

COLLECT → REVIEW → APPROVE → PUBLISH → CHECK

RCM RADIO MEDIA

Daily Checks

Use the dashboard monitor to spot issues early

What to check in the admin dashboard

Privacy & data monitor

- Platform account links and whether required credentials are present.
- Social/news sync status, last check time and stored item counts.
- Encryption-key health for any saved TikTok token.

Review queue

- Approve only verified stories, social posts, comments and partner uploads.
- Unpublished items are not visible to listeners.

Automation & email

- Check last run and status for feed sync and email digest jobs.
- Email delivery needs Gmail settings, a public HTTPS URL and confirmed subscribers.
- The monitor shows configuration status—not secret values.

If something looks wrong

- Refresh the feed once and read the status message.
- If a job is missing or overdue, check its host scheduler and server logs.
- If a module is missing, run the matching database migration.

Local testing links

This computer: http://localhost:8080/rcm-radio-media/

Another device on the same Wi-Fi: use http://HOST-IP:8080/rcm-radio-media/ (find HOST-IP with **ipconfig** on the XAMPP computer).

The computer must stay on, connected to Wi-Fi, and running Apache and MariaDB. A shared Wi-Fi may block device-to-device access.

Keep it safe

- Share only public site pages. Never share admin passwords, API keys or Gmail app passwords.
- XAMPP is for local testing, not public internet hosting. Use a maintained PHP host and HTTPS for a public launch.
- Public news/social content is readable so the website can display it. Protect database access and backups.
